## PREFACE

Volume I, Counties and State Economic Areas, ls one of the three principal reports presenting the results of the 1954 Census of Agriculture. This volume, in 33 parts, pre sents the compilation of the information glven by farm operators to Census enumerators in 1954.

The 1954 Census of Agriculture was taken in conformity with the Act of Congress (Title 13, United States Code) npproved August 31, 1954, which includes provisions for the mid-decade censuses of agriculture.

The collection of the data was carried out by Census enmmerators dlrected by supervisors appointed by the Director of the Census and working under the direction of Jack B. Robertson, then Chief, Field Division. Ernest R. Underwood, then special Assistant to the Director, was responsible for the recruitment of the field staff. The planning of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Dirision, and Warder B. Jenkins, Assistant Chief. They were assisted by Hilton E. Robison, Orvin L. Wilhite, Hubert L. Collins, Benjamin J. Tepping, Lois Hutchison, Carl R. Nyman, J. Thomas Breen, Robert S. Overton, Merton V. Lindquist, Russell V. Oliver, Charles F. Frazier, Gladys L. Eagle, Orville M. Slye, Gaylord G. Green, Harold N. Cox, and Henry A. Tucker.

Acknowledgment is made of the technical assistance and the loan of technical personnel by the United States Department of Agriculture in the planning, the ennmeration, and the compilation of the 1954 Census of Agriculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1954 REPORTS

Volume I.-Countles and State Economic Areas. Statistics for counties include number of farms, acreage, value, and farm operators; farms ly color and tenure of operator; facilities and equipment; use of commercial fertilizer; farm labor; farm expenditures; livestock and hivestock products; specified crops harrested; farms classified by tyle of farm and by economic class; and value of products sold by source.

Data for State economic areas include farms and farm eharacteristics by tenure of operator, hy type farm, and by economic class. Volume 1 is published in 33 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | New England States: Maine |  | West North Central: <br> Minnesota |  | East Sonth Central - Continued Alabama |
|  | New Hampshire. | 8 | Minnesota. | 22 | Mississippi. |
|  | Vermont. | 10 | Missouri. |  | West South Central: |
|  | Massachusetts. | 11 | North Dakota and South | 23 | Arkansas. |
|  | Middle Atlantic States: New York. New Jersey. Pennsylvania. | 13 | Kansas. <br> South Atlantic: <br> Delaware and Maryland. <br> Virginia and West Virginia. <br> North Carolina and South | 26 | Texas. |
|  |  |  |  |  | Texas. <br> Mountain: |
|  |  | 14 |  | 27 | Montana. |
|  |  | 15 |  | 28 | Idaho. |
|  | Last North Central: | 16 |  | 29 | Wyoning and Colorado. |
| 3 | Ohio. |  | Carolina. | 30 | New Mexico and Arizona. |
| 4 | Indiana. | 178 | Georgia. Florida. | 31 | Utah and Nevada. <br> Pacific: |
| 5 | Illinois. |  | East South Central: | 32 | Pacife: ${ }^{\text {Washington }}$ and Oregon. |
| 6 | Michigan. | 19 | Kentucky. | 33 | California. |
| 7 | Wisconsin. | 20 | Tennesse. |  |  |

Volume II.-General Report. Statistics hy Subjocts, United states Census of Auriculture, 10 h . Summary data and analyses of the data for States, for Geographte Divisions, and for the l'nited States by subjects as illustrated ly the chapter titles listed below:

| Chapter | Title | Chapter | Title |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Farms and Land in Farms. | VII | Field Crops and Vegetables. |  |
| 11 | Age, Residence, Years on Farm, Work Off Farm. | V111 | Fruits and Nuts, Horticultural Specialties, | Forest |
| $\xrightarrow{111}$ | Farm Facilities, Farm Equipment. |  | Products. |  |
| IV | Farm Labor. Use of Fertilizer, Farm Expenditures, and Cash Rent. | 1X | Value of Farm Produets. <br> Color, Race, and Tenure of Farm Operator. |  |
| V | Size of Farm. | X1 | Economic Class of Farm. |  |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |  |

## Volume III.-Special Reports

Part 1.-Multiple-unlt Operations. This report will be similar tor Part 2 of Volume $V$ of the reports for the 1950 Census of Agriculture. it will present statistios for appoximately 900 counties and State eeonomic areas in 12 sumthern Stales amd Missouri for the number and characteristics of multiple-mit operitions and farms in multiple units.

Part 2.-Ranking Agricultural Counties. This special reput will present statistics for selected itens of inventory and agricultural production for the leading counties in the linited States.

Part 3.-Alaska, Hawaii, Puerto Rico, District of Columbia, and U. S. Possessions. These areas were not included in the 19-5t Census of Agriculturn. 'The available eurrent data from various Giovermment sources will be compiled and published in this report.

Part 4.-Agriculture, 1954, a Graphic Summary. This report will present graphically somo of the significant facts regarding agriculture and agricultural frombetion as revealed by the 1954 Pensus of Agriculture.

Part 5.-Farm-mortgage Debt. This will be a rooperativo study by the Agricultural Researeli Service of the U. S. Depariment of Agrienlture and the Burean of the Census. It will present, by Siates, data based on the 1954 Census of Agriculture and a slecial mail survey to be comblacted in January 1956, on the number of mortgaged farms, the amount of morigage debt, and the amonnt of debt leeld by principal lending agencies.

Part 6.-Irrigation in Humid Areas. This cooperative report by the Agricultural Researel Service of the U. S. Department of Anriculture and the Burean of the census will present data obtained by a mail survey of oprators of irrisated farms in 28 States on the source of water, mothod of applying water, numher of pumps used, arres of crops irriated in 19.4t and 1055, the number of times each crop was irrisated, and the cost of irrigation equipment and the irrigation system.

Part 7.-Popular Report of the 1954 Census of Agriculture. This report is plammed to be a gemeral, abs-torad publicalion for the reneral public on the status and hroad characteristies of Inited States agricolthere. It will seek to dolineate such aspects of arriculture as the geographic distribution and differences by size of farm for surlt fems as farm atoreage, principal crops, and important kinds of livestock, farm facilities, farm equipment, usp of fertilizer", soil conservation practices, farm temure, and farm income.
Part 8.-Size of Operation by Type of Farm. This will he a coop)erative sjeedial repert to he prepared in comperation with the Agricultural Research Sorvier of the U . S. Department of Agrichlture. This repert will comtain data for 119 edomomic sultregions, (essentially gencral typeof-farming aneas) showing the general characleristios for bach type of farm by economice chass. It will provithe data for a corrent amalysis of the diffrences that exist among froups of farms of the same tale. It will furnish statistial basis for a realistio examination of production of sueh fommodilis's as wheat, colton, and dairy products in connection with actual or proposed sovermmental policios and programs.

## INTRODUCTION

(VII)

## INTRODUCTION

This report presents data relating to the agriculture of the Unlted States hased on the most recent census of agriculture taken in the fall of 1954 . The tabtes also include some comparative data from earlier censuses.
History and legal basis.-The current census extends the number of nationwlde agricultural censuses to 16. Initially, an agricultural enumeration was taken in conjunctlon with the Decennlal Census of Population in 1840. Congress first provided for a mid-decennial census for the year 1915; however, abnormallties created by World War I prevented the taking of this census. Since 1020 , a national agricultural census has been taken each five years.

The 1954 Census of Agriculture was anthorized by an Act of Congress apmoved June 18, 1929, and amended July 16, 1952. Section 16 of the Act, as amended, reads as follows: "That there shall be taken, beginning in the month of Octolser 1954, and in the same month of every tenth year thereafter, a census of agriculture. The census herein urovided for shall include each state, but shall not include the District of Columbia, Alaska, Hawaii, Puerto Rico, or such other areas or territories over which the United States exercises sovereignty or jurisdiction: Provided, however, that as to the areas excluded from such census it is directed that data available from various Govermment sources shall be included as an appendix to the report of such census. The Secretary of Commerce is authorized to collect such prelimsnary or supplementary statistics, either in advance of, or after the taking of such census, as are necessary to the initiation, taking, or completion thereof. The inquiries, and the number, form, and subdivisions thereof for the census provided for in this section shall be determined by the secretary of Commerce."

The initial appropriation for map preparation, field enumeration, and a part of the office processing was obtained under this authority. Subsequently, the Congress, in a code revision apןroved August 31, 1954, incorporated the provisions for all censuses in a code which may be eited as "Title 13, United States Code."

The request for funds for fiscal year 1954 included funds for preparatory work for a complete census of agriculture to be taken in the fall of 1954. This request was not approved by the Congress. However, a limited apropriation was nade for expenses for "spot checking business, manufactures, and agriculture in such manner as the Secretary of Commerce should decide to be most helpful and informative to said undertakings." Since one of the lmportant uses of quinquennial agricultural census statistics is to serve as a benchmark for the annual estimates of production and inventories prepared by the Unlted States Department of Agricnlture, the assumption was made that a "spot check" should provide reliable totals for a limited number of items by States and major producing areas. Accordingly, a sample census was conducted as a pretest of procedures in Utah and Virginia, heginning in October 1953. These survess are more fully described in separate reports for those two States, published in 1954.

Congress, in an appropriation Aet approved July 2, 1954, appropriated $\$ 16,000,000$ for the expenses necessary for taking, compiling, and publishing the 1954 Census of Agriculture, as authorized by law. Additional funds, amounting to $\$ 5,500,000$, were appropriated in 1955 in order to complete the work on the 1954 Census.

Plan of presentation of statistics.-This refort follows the same general plan of presentation as that for 1950, the last complete
census of agriculture. The report is a part of Volume 1 which comprises 33 reports. Each part of Volume 1 presents the data for each county and each State economic area for one or more States as well as state totals for those States for which county and State economic area data are shown. Statisties are most revealing when comparisons are available. Therefore, comparable data gathered in the 1950 Census of Agriculture are fiven for counties and for State economic areas. Comprative data for the States are given for each snccessive census year herinning with 1920. However, for some items, the data obtained in IUSt are the only unes available.
The tables provide totals for counties for nearly ill it enus for which information was ohtained in the 19:4 Census. Howerer, most data by economic chass of farm, type of farm, and color and tenure of farm operator ale presented only for Sitate ecomomic areas. State economic areas represent groupings of connties within a State. Outside of metropolition areas, the State emmomic areas are, in general, the same as state trie-of-farming areas. (A description of State economic areas is given in al Sperial Report of the 1950 Census, entitled "State Lconomic Areas: A Description of the Procedure Used in Making a Functional Grouping of the Counties in the United States.") A map showing the State economic areas is shown at the beginning of chapter $C$ of this report.

The Aet of Congress excluded from the field enumeration the agriculture in Alaska, Hawaii, Puerto Rico, District of Colmmbin, and U.S. possessions. Available statistios, obtained from other sources, for these areas are included in Part 3 of Volume III.

Data for most of the items included in the 1954 Census of Arriculture, as in prior censuses, were tabulated for "minor civil divisions" or areas smaller than countles. The term "minor civil division" is applied to the primary sublivisions of the counties. These may be townships, precinets, districts, independent municipalities, unorganized territory, etc. The figures for these smaller areas are not included in any of the regular reports. However, it is possible to obtain data for small geographic areas, as heretofore, by paying the cost of checking the data and preparing the necessary statistleal tables.

Prior to the 1954 Census, an enumeration district did not laclude more than one minor civil division, even though the township, precinct, or the like often did not have enough farms to provide a full workload for an enumerator. The aim in establishlng the 1954 enumeration districts was to make them larse enough to keep each enumerator fully occupied in his area for a thiee-week, or possibly a four-week, period. Hence, some enumeration districts included more than one minor civil division. Such combined minor divisions were always adjacent. An enumeration district never comprlsed the whole of one minor civil division and a part of another nor a part of two or more minor civil divisions. A minor civil division which included too many farms for one enumerator was divided into two or more enumeration districts.
The tabulations, as made by machines, in some cases provided totals for a single minor civll division-even though that required a grouping of enumeration districts-and, in wher cases, they provided totals for two or more minor civil divisions combined. In the latter instance, the small-area data will be readily avallable ouly for combined totals for adjoining minor cirll divisions. If there is need for making a separation of the data for such combinations, this is possible at some additional
cost, since each questionnaire contains the mane of the minor eivil division in which the farm headquarters was locatent.

Operations for 1954 Census.-The Aet providing for the 1954 C'ensus of Agriculture states that "the imquiries, and the number, form, and sublivision thereof . . shall he determined by the Secretary of commerce." The staff of the Burean of the 'ensus prepared the questionmare fur the 19nt Census of Agricilture on the basis of experience ohtained in prior censuses, on the basis of an analysis of the sample survey for the States of Utah and Virginia for the calendar vear 1953, and on the basis of the advice of a Spreial Advisory Committee for the 1954 Census of Agriculture. The Advisory Committee comprised representatives of the U. S. Departurent of Agriculture, State Agricoltaral Colleges, state Departments of Aqriculture, The American Farm Eemomie Assmiation, The American Statistical Association, The Association of Land-Grant Colleges and Universities, The Agricoltural Publishers Assoriation, The Farm Equipment Institute, The American Fiarm Bureau Federation, The National Grange, The National ('ommeil of Farmers' Comerativas, and the Farmers' Educational and Conperative Vnion of America.

The Sterial Advisory (mmmittee had also assisied in deciding the induiries to be included on the questiomatire for the $19 \mathrm{~m}^{-3}$ sample census for C'tah and Virginia. loming the planning. State Agricultmal ('olleges, the 1 . S. Dpmatment of Adrionlture, and other major nsers of data from the cersus of agriculture were asked to submit sugerested inguiries for the census. The mumbrio of inquiries recommended greatly exceeded thes momber that rould le incluted in the census. Ther Sureial Atvisory Committee and the stalf of the Burean recommended the indusion or exclasion of these inguiries after giving eomsideration to the possibilities of obtaining the information in some waty other than throush the census of agriculture, to the adequacy of the information that might be serined in the census, to the avalability of data from other sonrces, and to the usefuhmess of the data, etc. This eommitter reviewed the plans ant questiomaires for the 1073 sample enumeration and the 1954 Census of Agriculture as they were developed, and suhmitted recommendations ragirding these plans and questionnaires.

The eontent of the 21 resional questimmaires (ome for eath State or group of adjacent States) was similar to that of the questionnalres used for the Utah and Virainia sample survers condncted in 1953. There were variations region by region in the questionnaires to provide for differences in rops wrown, in livestock production, and in cultural practices. Also, the positions of inquiries wore changed in order to provide for the entumeration of some items for a limited number of farms even though other inquiries were made for all farms.

An agriconltural census that collects vast quantities of reliable information requires that all employees be trained and that they adhere carefully to preserihed procedures as well as time schedules. For the 1954 Census of Agriculture, the Burean devised a training progran so that all emplosees receivet instructions fur the respective johs. In most instances, training sessions were held near the areas in which employees worked and immediately prior to the beginning of their assignments.

The 1954 enumeration required approximately 30,000 enumerators who were supervised by some 2,200 erew leaders. These persons were supervised by 119 field offices organized under tive regional offices. From October 4 to November 8, 10.54, depending upon the State and the area, Irained enmmerators began their work. Their work was to ohlain for every farm the required information about that farm's operations, such as its crops, livestock, poultry, farm expenses, equipment and facilities, and some facts about the farm operator.

About two weeks before the census starting date, questionnaires were distributed to all box holders on the rural pwstal routes in all excent a few Sonthern States. The questionnaire was accompanied by a letter asking the farm operator to examine it and to answer as many of the questions as possible prior to the visit of the census ennmerator. By this procedure, the Burean expected
to expedite the work of the enumerator and to improve the quality of the information given by farmers. By reading the questionnaire, farmers knew what was wanted and could chock their records in advance of the emmerator's visit.

A good census requires a complete as well as an accurate enumeration. Several terhniques were used to help obtain a good census in 1054.

Instructions covering census procedures were designed in such a manner that objective eriteria were supplied, and enmmerators were not expected to rely on their own opinions or judgments concerning census entries or classifications. For example, an enmmerator was required to complete an ariculture questionnaire when specified eonditions were met. He was not required to decide first what constituted a farm and then to obtain a questionnaire. Instead, a questionnaire was completed whenever minimum conditions were satisfled. Then, during central office processing operations, a decision was made-on the basis of carefully defined criteria-as to which questionnaires represented farms.

To belp in insuring the completeness of the enumeration, anumerators were provided with a specially desioned Enumerator's Record Book in which to list heads of households for the dwellings in their enmmeration districts and names of the tenants or owners for places on which no one lived. The Enumerator's lecord Book contained questions about the agricultural operations on the place. The answers to these questions determined whether an agriculture questionnaire was required for the phace and, also. whether this enumerator or an enumeralor in another enumeration district was required to fill ont the questionnaire.

In order to minimize the cost of the enumeration, procedures were developed to limit the listing of heads of households and of other places in urban areas, incorporated places, and built-up residential areas. In accordance with these procedures, enmmeration districts were classified, prior to the enumeration, into three groups on the basis of the density of dwellings in relation to the number of farms aceording to the 1950 Censuses of Agricuiture and Popmlation.

In general, the enmmeration districts with no well-defined rlmeter of dwellings were considered to be open-country areas and were (lassitied as Group) 1 Enumeration Districts. For Group I Enumeration Districts the emmerator was required to list in his Enumerator's lecord Book the name of the head of each household within his distriet. If no one lived on a tract of land, he Was reduired to list the name of the person who rented the land, worked it on shares, used it for livestock, or, If the land was not used for agricultural purposes, the name of the owner. There were approximately 15,300 Group I Enumeration Districts. These enumeration districts contalined $2.778,000$ farms and $4,263,000$ Awelling units in 1950.

The rural enumeration districts in which the number of dwellings was large in relation to the number of farms were classified as Group II Enumeration Distlicts. In these enumeration districts the enumerator was required to list all dwelling places in his district except those on less than one acre of land in built-up residential areas, such as snall incorporated or unincorporated villages or the built-mp areas adjacent to towns or cities. lle was also required to determine, by asking locally, whether there were any farms or any places of one or more acres within the huilt-up areas. Outside the buitt-up areas he was required to list the head of every household. There were approximately 14,800 enumeration distriets elassified as Group II. These enumeration districts had $8,974,000$ dwelling units and 2,420,000 farms in 1950.

Most incorporated places and unincorporated villages with approximately 150 or more dwellings were classified as Group III Enumeration Districts. There were approxlmately 11,000 such enumeration districts and these contained 161,000 farms in 1950. For Gromp Il Enmmeration listricts, the emmerator was given a list of farm operators emmerated in the 19.0 Census of Agriculture and was instructed to visit each place listed and find out

Whether an anriculture questiomaire was recuired. Any phace used for agriculture was to be listed in his Enumerator's Record buok and an agriculture questiomaire was to be obtained. If the place was no longer used for agriculture, an explanation was to be made on the list furnished the enumerator. The enumerator was instructed to ask at each of these places whether there were ans other farms or any places of 3 or more acres in the neighborhood.

A few enumeration districts that comprised an incorporated phace or that were within an incorporated city were classiffed as Group I or Group it if the number of farms was large. Also, a few vers extensive rural districts requiring considerable travel were classified in Group III when the number of farms was small.

The method preseribed for eanvassing an enumeration district helped to insure complete coverage. The enumerator was instructed to proceed in a systematic manner from a logical starting point. He listed each place and each dwelling on suceessive lines in the Enumerator's Record Rook. In addition, he was required to identify these on his enumerator's map with a cross reference to the Enumerator"s Record Book. This procedure helped him to determine, by looking at his map, the extent of coverage at any given time. It also helped the crew leader in checking to see that coverage was complete.

Some farms were given special attention to insure their inclusion in the enumeration. Prior to the enumeration, a list known as "speeified farms" was prepared from records of the 10.00 Census of Agriculture. Farms having unusually large agricultural operations were included in this list. During the enumeration a eareful check was made to see that each place on the specifiedfarm hist was accounted for. This procedure helped to insure that units which could have a significant effeet upon the census data were not omilted from the enumeration. (For a detailed exphanation of specified farms, see page XII.)

Some farm units other than specified farms also received special attention to insure complete coverage. Prior to the field enumeration, lists were ohtained of places known to he specializing in suecific types of agricultural production, such as garmage-feeding operations, broiker operations, large turkey farms, livestock feed lots, cranberry bogs, and citrus groves. For some of these operations, the list remresented a nationwide effort to insure coverage, while for whers, only some of the intensive areas of production were given this suecial attention. These lists were prepared, in part, with the cooperation of the Agricultural Narketing Service of the U. S. Department of Agriculture and state Agricultural Statisticians. During the enumeration, the enumerator was required to obtain a questiomaire for each place or otherwise satisfactorily arcount for each place on the list of specified farms or on other special lists.

Some areas of the Hirh Plains required special consideration since the usual enumeration procedure was complicated by the prevalence of nonresident operators and widely sattered tracts operated as one farm. In these areas a special mapting form was used to insure complete coverage. Land was checked off on the mapping form by section, township, and range as it was enumerated. This check map, designed for photting sections within a township, was sublivided into 16 parts of 40 aeres each. Enumerators were required to indicate on this form all land in farms that they enumerated. Cross references were made between the questionnaire and the map. The enumerator identified land for a given questionnaire on his check map by writing the number identifying the questionnaire in each corresponding 40 acre square of the cheek map. The eheck map helped the enumerator and, subsequently, the crew leader and other personnel reviewing the enumerator's work to determine whether the coverage of the enumeration district was complete. This procedure was used in atl of North Dakota and South Dakota and selected counties in Colorado, Kansas, Montana, Nebraska, New Mexico, and Oklahoma. In general, the areas for which such maps were used corresponded with the major wheat-producing sections with low rainfall.

A special supplementary puestionnaire was used in approximately !oo counties in the South. This questionnaire, desigmated the Landord-Tenant Questionnaire, aided in the enumeration of cropper and other tenant farms which were parts of larger landholdings. This additional form was completed when two or more agriculture questiomaires were needed for a landholding. Since it called for the name and arricultural operations of each tenant on the landholding, the procedure enabled an enumerator to determine that all operations were reported completely and only once. The Enumerator's Record Book, used in these selected southern counties, differed from that used elsewhere. The southern version helped the enumerator to identify the landholdings for which this supplementary landord-tenant form was required.

Crew leaders, in sutpervising enumerators, began reviewing questionnaires, maps, and other forms and checking the enumerator's work for completeness of coverage and quality almost as soon as the enumeration was started. The erew leader and his enumerators were required to make the records of their restrective areas as accurate and as complete as possible.

White assembling records, the field processing offices also made certain checks. Although these offices performed no detailed editing of questionnaires, some steps were taken to detect enumeration districts in which the enumeratir's work was not fully satisfactors, especially in regard to covel age. The 26 processing offices were given a form, for each county, which contained data from the 1950 Census for the number of farms and land in farms. Where possible, this furm gave the 1950 comparative data for the enumeration districts or for the minor civil divisions comprising each counts. For most connties, it was possible to furnish, at the cumoty level, an additional check figure. This figure was the acreage of one of the following crops: wheat, corn, rotton, tobacer, or rice. It most instances, these check figures represented measured acreages (before harvest) as determined by the Commodity Stabilization Service of the U. S. Department of Agriculture. By checking totals for the enumeration districts with these check data, it was possible to determine and remeds obvious underenumeration before records were released from field processing offices. The 1954 totats for the county, together with the check data, were sent to the Washington office for review and approval before the enmmeration was considered acceptable.

After the canvass of an enumeration district was completed, the supervising erew leader collected the questionnaires and other records from the enumerator and sent them to the processing oflice for his area. The processing offices made some checks on the enumeration in each enumeration district. In this checking, emphasis was placed upon preparation of payrolts, completeness of coverage, and the correct application of the sampling procedure.
The final operations for the agricultural census were handled in central offices. The Washington office was the focal point of these activities; hut, for the first time, some of the agricuttural census operations were decentralized into areas outside of Washingtom. Census operations offices were established at Detroit, Michigan and I'ittsburg, Kansas.

Upon their release from field processing offices, records were transferred to the two Census operations offices. Although there were exeeptions, in general, records from the Northern and Northeastern States were sent to the Detroit office and those from Southern and Western States were sent to Pittshurg, Kansas. At these offices, questionnaires were edited and coded and the information was entered on punch cards for tabulation.
In the operations offices, the checking, editing, and coding were therformed for individual agriculture questiomaires. The checking consisted of seeing (1) that the questionnaires were completels filled out; (2) that the acreage of individual erops harvested was in reasonable agreement with the acreage of eropland harvested when 100 or more acres of cromand harvested were
reworted; (3) that the acres of land chassified according to use accounted for the entire farm acreage for farms having 200 acres or more: (4) that the total of the acreage for the various uses of rorn, sorghum, soyheans, cowpeas, and peanuts was in reasonable agreement with the total acreage reported for all purposes for each of these crons; ( (1) that the age and sex hreakdown for cattle, hoss, and sheep added to approximately the total number of such animals of all ages; and ( 6 ) that all entries for related items were reasonably eonsistent. Edithig consisted of the identification and withdrawal of questionnaires filled for places not qualifying as farms; the selection of questionnaires with entries of unnsually large size for review hy the technical staff; the selection of groups of questionnaires with common rejorting errors in an individual euumeration district for referral to technical personnel for review; and the correction of obvious inconsistencles, such as reporting in an incorrect unit, or reporting in an improper place on the questionnaire. Coding consisted of entering code numbers for crops for which there were no seplarate inquiries on the questionnaire, for color and tenure of operator, and for irrigation; and, for a sample of farms, of entering codes for economic class of farin and dype of farm. Entlies determined by the technical staff to he in error were corrpcted on the basis of relationshits existing on nearly farms or, if the entries were large. on the basis of correspondence with the farm operator. In case of information missing for a group of questlons, estimates were prepared on the hasis of adjacent questionnaires for farms with similar operatlons and, in some cases, on the hasis of information obtained by mail from farm operators. When estimates were made, letters were mailed to the farm ojerators to velify the information and, if the estimates were not in reasonable agreement with the information contained in the replies, the entries were corrected before the tabulations were made.

After punch cards were prepared, the punch cards, together with records containing the corresponding basic data, were forwarded to the Washington office for tabulation. Once on punch cards, the data were sorted, listed, or otherwise handled mechanically to facilitate making final checks and to obtain totals. One of the lnitial and primary steps in the machine handling of the munch cards was to separate those cards which lacked necessary information, those on which the punched data were inconsistent or impossible, and those on which the relationships were possible hut the data were of such magnitude that a further review of the individual questionnaires was warranted. These cards containing questionable data or lacking data were examined, checked to the agriculture questionnaires, and comereted, if necessary, lefore the tabulations were made.

Finally, tabulations were examined from the standpoint of over-ill reasonableness and consistency. This examination required the judgment of specialists and was the primary responstbllity of senlor Census staff members. However, qualified State personnel of the Agricultural Marketing Service, U. S. Department of Agriculture, assisted in examining the data, especially those for crops and livestock, evaluating the results, and calling attenthon to the situations for which further checking wis necessary.

## DEFINITIONS AND EXPLANATIONS

Specified farms.-"Specified farms" refers to the Jarger farms that were selected for special handling during the enumeration and during the processing of the agrlculture questionnaires. Although the criferia for their selection have varted since this technique was first used in the 1945 Census of Agriculture, the basle purposes for employing this technique have not changed. One purpose for using a list of speclfied farms was to help to get a complete enumeration.

The criteria for selecting specified farms were kept as simple as possible in order to facilitate the work of enumeration. In most States, only one item was considered in classifying farms as "specified." The foliowing are the criteria used for the 1954 Census:

| Criteria | Area |
| :---: | :---: |
| Land in the farm-1,000 acres or more $\qquad$ | All States |
| Cropland harvested: |  |
| 200 acres or more | Florida |
| 500 acres or more | Michigan, Minnesota, |
| Irrigated cropland harvested: <br> 200 acres or more | Arizona, California, Louisiana |
| Cattle and calves: |  |
| 100 or more | Alabama, Mississippi, N. W. Missouri |
| 200 or more | Louisiana | Milk cows:

100 or more
Arizona, Callfornia, Florida
Chickens sold :
70,000 or more
Delaware, Maryland, West Virginia
Occasionally, a farm which did not meet any of the criteria chosen, but which hulked large in respert to some other farm characteristics, had to be treated as a specified farm to reduce its effect on the results based on a sample of farms.

In terms of total agricultural production, the operators of specified farms account for a significant part of the total production. For example, in the 1950 Census, 71,328 farms (then designated "large" farms) were handled on a special hasis. Although this number was only 1.3 percent of all farms, these "large" farms accounted for $\mathbf{1 7 . 3}$ percent of the value of all farm products sold and 33.1 percent of all land in farms. The criteria used for establishing the group of specified farms for special bandling in the 1954 Census resulted in more than twice as many farms ( 147,000 in the 1954 Census as compared with 72,000 in 1950 ) being given special attention.

## General Farm Information

Date of ennmeration.-The enumeration of the 1954 Census of Agriculture was made during the latter part of 1954 . In the 1950 Census the starting date for the enumeration was April 1. The 1954 Census beginning dates were varied by areas or States, ranging from October 4 to Novenber 8 . In general, the varied starting dates were based buon (1) selecting dates late enough for the enumeration to follow the harvesting of the bulk of important crops, (2) selfing the dates early enough to avoid undesirable weather and travel conditions during the ennmeration, and (3) arranging for the enumeration to be sulastantialty completed prior to customary dates when farm oterators move from one farm to another. The average date of enumeration for the 1954 Census for each county is given in County Table 7 , and the percentage of farms enumerated by various dates for the State and the date or dates for the starting of the enumeration are given in State Talble 11.

Information for inventory items is based on the situation as of the actuai day of enumeration. Data on acreage and quantity of crops harvested are for the crop sear 1954. Data on sales of crons relate to crops harvested in the year 19.4 regardless of when sold; data on sales of livestock products relate to the production and sales during the calendar year 19.54 . Since the period to be included was not yet completed for some items at the time of enumeration, special emphasis was phaced upon including accurate estimates for such items for the remainder of the period. For example, the question relating to dairy products stated, "Be sure to include dairy products which you will sell before January 1 , 1055."

A farm.-For the 1954 and the 1950 Censuses of Agriculture, places of 3 or more acres were counted as farms lf the annual ralue of agricultural products, exclusive of home-garden products, amounted to $\$ 150$ or more. The agricultural products could have been elther for home use or for sale. Places of tess than 3 acres were counted as farms only if the annual value of sales of agrlcultural products amounted to $\$ 150$ or more. I'laces for which the value of agricultural products for 1954 was less than these minima because of crop failure or other unusual conditions, and
places operated at the time of the census for the first time were counted as farms if normally they could be expected to produce these minimum quantities of agricultural products.

All the land under the control of one person or partnership was included as one farm. Control may have been through ownership, or through lease, rental, or cropping arrangement.

For the 1954 Census, enumerators were instructed to obtain an agriculture questionnaire for all phaces that the operator considered a farm and for all places having during 1954 (1) ang hogs, cattle, sheel', or goats: (2) any crops such as corn, oats, hay, or tobacen; (3) 20 or more chickens, turkeys, and geese; (4) 20 or more fruit trees, grapevines, and planted nut trees; or (5) any regetables, berries, or nursery or greenhonse products grown for sate. Thus, agriculture questionnaires were filled tor more places than those qualifying as farms.

The determination as to which reports were to be included in the tabulations as farms was made during the central office processing of questionnaires.

For the 1945 and earlier censuses of agriculture, the definition of a farm was somewhat more inchusive. Census enmerators were provided with the definition of a farm and were instructed to fill reports only for those places which met the criteria. From 1925 to $\mathbf{1 9 4 5}$, farms for census purposes included places of 3 or more acres on which there were agricultural operations, and places of less than 3 acres with agricultural products for home use or for sale with a value of $\$ 2.00$ or more. For places of 3 or more acres, no minimum quantity of agricultural production was required for purposes of enumeration: for phaces of under 3 acres all the agricultural products valued at $\$ 250$ or more may have been for home use and not for sale. The only reports excluded from the tabulations were those taken in error and those with vers limited agricultural production, such as only a small home garden, a few fruit trees, a very small flock of chickens, etc. In 1945, reports for places of 3 acres or more with limited agricultural operations were retained if there were 3 or more acres of eropland and pasture, or if the value of protucts in 1944 amounted to $\$ 150$ or more when there was less than 3 acres of cropland and pasture.

Because of changes in price level, the $\$ 250$ limit for ralue of products for farms under 3 acres resulted in the inclusion of tarying uumbers of farms in the several censuses prior to 1950.

The change in the definition of a farm in 1950, and continued In 1954, resulted in a decrease in the number of farms as compared with earlier censuses, especially in the number of farms of 3 or more acres in size. Places of 3 or more acres with a value of agricultural products of less than $\$ 150$ were not counted as farms In the 1954 and 1950 Censuses. In some cases, these places would have been counted as farms if the criteria used in 1954 and 1950 had been the same as those used in previous censuses. The change in the definition of a farm had no appreciable effect on the totals for livestock or crops, for the places affected by this change ordinarily accounted for less than 1 percent of the total for a county or State.

There are two figures published for the number of farms for each countr in 1954. One is an actual count of all farms enumerated, and the other is an estimate based upon the number of sample farms multiplied by 5 , plus the number of specified farms. In almost every countr, the actual number of farms and the estimated number of farms differ. Because of sampling variability, the selection of the sample of farms seldom resulted in the inclusion of exactly 20 percent of the non-specified farms. The number of farms in the sample in a country was accepted if this number was within predetermined limits. The counties that were not accentalle were adjusted to bring the number of sample farms within the predetermined limits.

Therefore, the actual number of farms in the sample is more or less than 20 percent in most instances. Similarly, the estimated total for information obtained for the sample of farms may be slightly more or slightly less than the totals which would have
been obtained if the data had been tabulated for all farms. Therefore, occasionally the estimated number of farms reporting for some items mas be greater than the total number of farms enumerated. The estimated number of farms is shown in the tables so that estimates based on the farms in the sample can be rclated to the estinated number of farms rather than to the actual number of farms.

Enumeration of land located in more than one county.-Land in an individual farm mas be located in two or more counties. In such case, the entire farm was enumerated in only one county. It the farm olerator lived on the farm, the farm was enumerated in the countr in which the farm onerator lived. If the farm operator did not live on the farm, the figures for the farm were included in the comity in which the farm headquarters was located. If there was any question as to the location of the headquarters of the farm, the farm was included in the connty in which most of the land was located.

Farm operator.-A "farm operator" is a person who operates a farm, either performing the labor himself or directly supervising it. Ne may be an owner, a hired managet, or a tenant, renter, or sharecropper. If he rents land to others or has land cropped for him by others, he is listed as the operator of only that land which he retains. In the case of a partnership, only one partner was inchuded as the onerator. The number of farm operators is considered the same as the number of farms.

Farms reporting or operators reporting.-Figures for farms reborting or operators reporting, based on a tabulation of all farms, represent the number of farms, or farm operators, for which the specified item was reported. For example, if there were $\mathbf{1 , 9 2 2}$ farms in a country and only 1,465 had chickens over 4 months old on hand, the number of farms reporting chickens would be $1.46 \%$. The difference between the total number of farms and the number of farms reporting an item represents the number of farms not haring that item, provided the inquiry was answered completely for all farms.

For some of the items, such as the residence of the operator, for which reports were to have been obtained for all farms, figures are given for the number of farms not reporting. The number of farms, or operators, not reporting indicates the extent of the incompleteness of the reporting for the item.

Figures for farms reporting or operators reporting, hased on a tabulation for only a sample of farms, represent the total estimated from the sample, not the actual number of farms or operators reporting.

Land owned, rented, and managed.-The land to be included in each farm was determined by asking the number of acres owned. the acres rented from athers or worked on shares for others, and the acres rented to others or worked on shares by others. The acres in the farm were obtained by adding the acres owned and acres rented from others or worked on shares for others, and subtracting the acres rented to others on worked on shares ber others. In case of a managed farm, the person in charge was asked the total acreage managed for his emploser. The acreage that was rented to others or cropped hy others was subtracted from the total managed acreage.

For 1954 and 1950 , the figures for land owned, land rented from others, and land managed for others inchude land rented to others by farm operators. In earliev censuses, the enumerator was instructed to include all land rented from others and to exclude all land rented to others. Thus, he recorded only that portion of the arreage owned and the acreage rented from others which was retained by the farm operator. For prior censuses, the land included in each farm was essentially the same as that included for the 19.54 and 1050 Censuses.

Land owned.-land owned includes all land that the operator or his wife, or both, hold under title, purchase contract, home. stead law, or as one of the heirs, or as a trustee of an undivided estate.

Land rented from others.-Land rented from wthers includes land worked on shares for others, and land used rent free,
as well as all land rented or leased under other arrangements. Grazing land used under government permit was not included.

Land rented to others.-Many farm operators rent land to others. For the most part, the land rented to others represents agricultural land but it also includes tracts rented for residential or other purposes. When land is leased, rented, or cropped on shares, the tenant or cropper is considered the farm operator even though his landlord may exercise supervision over his operations. The landlord is considered as operating only that portion of the land not assigned to tenants or croppers.
Land area.-The approximate total land area reported for 1954 for States and counties is, in general, the same as that reported for the 1950,1945 , and 1940 Censuses. Changes since 1940 represent changes in boundary, actual changes in land area due to the construction of reservoirs, etc. The figures for 1940 represent a complete remeasurement of the United States and, therefore, may differ from the figures shown for earlier censuses.

Land in farms.-The acreage designated "land in farms" includes cousiderable areas of land not actually under cultivation and some land not used for pasture or grazing. All woodland and wasteland owned by farm operators, or included in tracts rented from others, is included as land in farms unless such land was held for other than agricultural purposes, or unless the acreage of such land held by a farm operator was unusually large. If a place had $1,000 \mathrm{or}$ more acres of land not being used for agricullural purposes and less that 10 percent of the total acreage in the place was used for agricultural purposes, the nonagricultural land in excess of the number of acres used for agricultural purposes was excluded from the farm area. In applying this rule, land used for crops, for pasture, or grazing, and land rented to others were considered to be land for agricultural purposes. On the other hand, land was defined as nonagricultural when it was woodland not pastured, or in house and barn lots, roads, lanes, ditches, or wasteland. The procedure used in 1950 for excluding unusually large acreages of nonagricultural land differed slightly from the one used for the current census. In 1950, adjnstments were made in places of 1,000 acres or more ( 5,000 acres or more in the 17 Western States) if less than 10 percent of the total acreage was used for agricultural purposes.

Except for open range and grazing land used under government permit, all grazing land was to be included as land in farms. Land used rent free was to be included as land rented from others. Grazing lands operated by grazing associations were to be reported in the name of the manager in charge. All land in Indian reservations used for growing crops or grazing livestock was to be included. Land in Indian reservations not reported by individual lndians or not rented to non-Indians was tu he reported in the name of the cooperatice group using the land. Thus, in some instances the entire Indian reservation was reported as one farm.

Land in farms according to use.-Land in farms was classifled according to the use made of it in 1954. The classes of land are mutnally exchnsive, i. e., each acre of land was included only once even though it may have had more than one use during the year.

## The classes are as follows:

Cropland harvested.-This includes land from which crops were harrested; land from which hay (including wild hay) was cut; and land in small fruits, orchards, vineyards, nurseries, and greenhouses. Land from which two or more crops were reported as harvested was to be counted only once.

The enumerator was instructed to check the flgure for cropland harvested for each farm by adding the acreages of the individual crops reported and subtracting the acres of land from which two crops were harvested. This procedure was repeated during the central office editing process for farms with 100 or more acres of cropland harvested.

If the harvested cropland was used for other purposes, either before or after the harvest of a crop, the enumerator was specifically instructed to report the acreage only under cropland harvested.

Cropland used only for pasture.-In the 1954 and 1950 Censuses, the enumerator's instructions stated that rotation pasture and all other cropland that was used only for pasture were to be included under this class. No further definition of cropland pastured was given the farm operator or enumerator. Permanent open pasture may. therefore, have been included under this item or under "other pasture," depending on whether the enumerator or farm operator considered it as cropland.

The flgures for 1945 and earlier censuses are not entirely comparable with those for the last two censuses. For 1945, the fogures include only cropland used solely for pasture in 1944 that had been plowed within the preceding seven years. The figures for this item, for the Censuses of 1940. 1935, and 1925, are more nearly comparable with those for the Censuses of 1954 and 1950 , as thev include land pastured that could have been plowed and used for crops without additional clearing, draining, or irrigatlng.

Cropland not harvested and not pastured.-This item includes idle cropland, land in soil-improvement crops only, land on which all crops failed, land seeded to crops for harvest after 1954, and cultivated summer fallow.

In the Western States, this class was subdivided to show separately the acres of cultivated summer fallow. In these States, the acreage not in cultivated summer fallow represents largely crop failure. There are very few counties in the Western States in which there is a large acreage of idle cropland or in which the growing of soil-improvement crops is an important use of the land.

In the States other than the Western Slates, this general class was subdivided to show separately the acres of idle cropland (not used for crops or for pasture in 1954). In these States, the incidence of crop failure is usually low. It was expected that the acreage figure that exclucled idle land would reflect the acreage in soil-improrement crops. However, the 1954 crop year was one of low rainfall in many Eastern and Southern States and, therefore, in these areas the acreage of cropland not harvested and not pastured includes more land on which all crops failed than would usually be the case.

Cultivated summer fallow.-This item includes cropland that was plowed and cultivated but left unseeded for several months to control weeds and conserve moisture. No land from which crops were harvested in 1954 was to be included under thls item.
Woodland pastured.-This includes all woodland that was used for pasture or grazing. The questionmaire contained the following instruction: "Include as woodland all wood lots and timber tracts and cntover land with ,young trees which have or will have value as wood or timber." No definition of woodland was given in 1950 to either farm operators or Census enumerators except an instruction to enumerators not to inrlude brush pasture as woodland. Some of the changes in woodhand acreages from one census to another may merely represent differences in interpretation of the meaning of woodland.

Woodland not pastured.-This includes all woodland that was not used for pasture or grazing. Vnusually large tracts of timberland reported as woodiand not pastured were excluded from the tabulations of land in farms when it was evident that such land was held primarily for nonagricultural purposes. The definition for woodland, as stated above, was used also for enumerating woodland not pastured.

Other pasture (not cropland and not woodland).-This includes rough and brush land pastured and any other land pastured that the respondent did not consider as either woodland or cropland. The figures for $19 \overline{7} 4$ and 1950 are comparable but for 1945 all nonwoodland pasture not plowed within the preceding 7 years was included. For the 1940 Census and earlier years, the figures are more nearly comparable with those for 1954 and 1950, except that the item may he somewhat less inclusive since land that could have been plowed and used for crops without additional clearing, draining, or irrigating was classified as plowable pasture (shown as cropland used only for pasture in the tahles).

Improved pasture. This item includes land in "other pasture" on which one or more of the following practices had been used: Liming, fertilizing, sceding to grasses or legumes, irrigating, draining, or controlling weeds and brush. The question on improved pasture was included in 1954 for the first time.
Other land (house lots, roads, wasteland, etc.).-This item includes house lots, barn lots, lanes, roads, ditches, and wasteland. It includes all land that does not belong under any of the other land-use classes.

In addition to the complete classification of land in farms according to nse, the tables also present data for three summary classifications as follows:

Cropland, total.-This ineludes erophand harrested, cropland used only for pasture, and cropland not harvested and not pastured.
Land pastured, total.-This includes erophand used onls for pasture, woodland pastured, and other pasture (not cropland and not woodland).
Woodland, total.--This ineludes woodland pastured and woodland not pastured.
Valne of land and buildings.- The value to be reported was the approximate amont for which the land and the huildings on it would sell. This item was obtained for onls a sample of the farms; however. the value was not reported for all the farms comprising the sample.

Many problems, not encountered in enumerating most agricultural items, are involved in ohtaining farm real-estate values. Most enumerated items require the respondent to make a statement based upon fact. It may he the number and value of farm animals sotd alive during the year or the number of lambs under 1 year old on the place. In either case, only information as to aetivities during a speeified period, or the situation as of a stated time, is required. This information is based umon actual transactions or existing conditions. But the estimation of the ralue of land and buildings is based largely umon opinion. In the event a farm had been recentls purchased, answers eould he based upon that experience. But many farms have not changed hands for many years, nor are ther eurrently for sale. In sneh cases, farm operators may have no clear basis for estimating the salue. In making an intelligent estimate, a respondent needs, first. to estimate the prevaling market ralue in the community. Secondly, he must in some way add to or subtract from this base to allow for his farm's sperial characteristies. In mans cases, a farm operator who would not sell his phace under ans circumstances may be inclined to gire a "market value" that is unreasonabls high. Some oferators who had purchased their real estate during leriods of relutitity low prices may give an estimate that is noduly intluenced bs that experience. Furthermore, the extent of rariation known to exist in real-estate values makes it difficult to estahlish checking procedures that will diselose inaceurate estimater.

Only arerage values of land and buildings jer farm and per acre are presented in this report. A total valne of the land and buildings for States. gengraphic divisions, and the United States, will be presented in Volume II.

Age of operator.-Farm operators were classified by age into six age groups. The average age of farm operators was calculated by dividing the total of ages of all farm oferators reporting age by the number of farm operators reportins.

Residence of farm operator.-Farm operators were classified by residence on the basis of whether or not they lived on the farm operated. Some of those not living on the farm operated lived on other farms. When a farm operator rented land from others or worked land on shares for others and had the use of a dwelling as part of the rental arrangement, the emmerator was instructed to consider the dwelling a part of the farm onerated. The dwelling assigned may have been on a tract other than that as signed for crops. Since some farm operators live on their farms only a portion of the year, comparability of the figures for various censuses may be affected to some extent by the date of the enumeration. In a few eases the enumerator failed to indicate the residence of the farm operator. Differences between the total number of farms and the number of farm operators by residence represent underreporting of this item.

Years on present farm (year began operation of present farm).The data on sears on present farm and year began operation of present farm were secured on the basis of the inquirs, "When did you begin to operate this place?
(Month)
(Year)
time of rear that farmers move is indicated by the month they began to oferate their farms, as shown bs a breakdown of the data for those farm operators who began to operate their present farms in the calendar gears labt and 19.8. The tabulation of years on present farm at each census is hased on the calendar year the operator began operating his farm. Beeause of differences in the date for various censuses, the figures are not fully combarable from one census to another.

Off-farm work and other income.-Many farm onerators receive a part of their income from sources other than the sate of farm products from their farms. The 19at Agriculture Questionnaire included several inquiries relating to work off the farm and nonfarm income. These inquiries called for the mmber of chass worked off the farm bs the farm operator; whether other members of the operator's famile worked off the farm: and whether the farm onerator received ineome from other sources, such as salt of products from land rented out, cash rent, boarders, old age assistance, pensions, veterans allowances, memployment compensation, interest, dividends, profits from nonfarm business, and hely from other members of the operator's family. Another inruirs asked whether the income of the onerator and his fanily from off-farm work and other sources was greater than the total value of all agricultural products sold from the farm in 1954. Off-farm work was to include work at nonfarm johs, businesses, or professions, whether performed on the farm premises or elsewhere ; also work on someone else's farm for pas or wages. Dxchange work was not to be inchuded.

The purposes of these four inquiries were (I) to obtain information in regard to the extent that farm operators performed off-farm work and the relation of other nonfarm income to the value of farm products sold and (2) to provide a hasis for the classification of farms by economic class (see Farms beco nomic (class, page XXII). The intent of the inquirs in regard to whether or not a member of the family had a nonfarm job. and the inquiry regarding income of the farm onerator from other nonfarm sources, was to obtain mure accurate replies to the inquiry regarding the relationship of the ineome from off-farm work and other sources to the total value of all agricultural products sold.

Specified facilities and equipment.-Inquiries were made in 1954 for a sample of farms to determine the presence or absence of selected items on each place such as (1) telephone, (2) piped running water, (3) electricity, (4) television set, (5) home freezer, (6) electrie pig brooder. (7) milking machine, and (S) power feed srinder. Surh facilities or equilment were to be counted even though temporarily ont of order. Piped running water was defined as water piped from a pressure system or hy gravity flow from a natural or artificial source. The enumerator's instructions stated that pig brooders were to inchade those heated br an electric heating element, by an infra-red or heat bulb, or by ordinary electrie hulbs. Thes could be homemade.

The number of selected trpes of other firm equipment was also ohtained for a sample of farms. The selpeted kinds of farm equipment tor le reported were (1) grain combines (for harvesting and threshing grains or seeds in one operation): (2) corn pickers: (3) pick-up balers (stationars ones not to be reported); (4) field forage harvesters (for field chopping of silage and forage crops) : ( 5 ) motortrucks: ( $b$ ) wheel tractors (other than garien): (T) gamen tractors; (S) crawler tractors (tracklavine, (aterpiliar) ; (!) automohiles; and (10) artificial ponds. reservoirs, and earth tanks.

Wheel tractors were to inchude homemade tractors but were not to include implements having huilt-in power units such as self-propelled combines, powered buck rakes, ete. "Piek-up" and truck-trailer combinations were to be revorted as motortrucks. School buses were not to be rejorted, and jeeps and station wagons were to be inchuded as motortrucks or antomobiles. depending on whether used for hating farm products or supplies, or as passenger vehieles.

Classification of farms by class of work power.-Farms wele grouped by class of work power on the basis of whether horses,
mules, or tractors (wheel or crawler, but not garden) were reforted. This classification does not present a complete picture of the work power used on all farms. For some farms, all the work power may be fuinished by the landlord; and for some farms, all the work power mas be hired. Thus, farms hiring all of the work power from others and those having it furnished are shown as having no work power, unless the work animals or tractors were kept on the tenant-operated tract.

Since the number of tractors was obtained for only a sample of farms, the number of farms by elass of work power represents an estimate.
Farm labor.-The farm-labor inquiries for 1954, made on a sample lasis, called for the number of persons doing farm work or chores on the place during a specified calendar week. Since starting dates of the 19.4 ennmeration varied by areas or States, the calendar week to which the farm-labor inquiries related varied atso. The calendar week was September 26-October 2 or October $24-30$. States with the September 20-October 2 calendar week were: Arizona, California, Colorado, Connecticut, Florida, Idaho, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesuta, Muntana, Nelraska, Nevada. New Hampshire, New Jersey, New Mexico, New York, North Dakota, OLlahoma, Oregon, lemusylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, Wisconsin, and Wyoning. States with the Octoher 24-30 ealendar week were: Alabama, Arkansas, Delaware, Georgia, Illinois, Indiana, Iowa, Maryland. Mississippi, Missouri, North Carolina, Ohio, South Garolina, Virginia, and West Virginia. Farm work was to include ans work, chores, or planning necessary to the operation of the farm or ranch business. Housework, contract construction work, and labor involved when equipment was lired (custom work) were not to be included.

The farm labor information was obtained in three parts: (1) Operators working, (2) unpaid members of the oferator's family working, and (3) hired persons working. Operators were considered as working if they worked 1 or more hours; unpaid members of the oterator's family, if thes worked 15 or more hours: and hired persons, if they worked any time during the calendar week specified. Instructions contained no specitications regarding age of the persons working.

Data shown for earlier censuses are not fully comparable with those for 1954, primarils herallse of differences in the period to which the data relate. The data for 1954 were purposely related to a period of trak farm employment. During 19.0 the labor inquiries were related to the calendar week preceding the actual enumeration. Although starting dates were identical in all states (April 1, 1:3H), several weeks were required to complete the field work. Therefore, the calendar week ureceding the enumeration was not the same for all farms. For the 1945 and 1935 Censuses, the number of farm workers related to the first week in danuary. The data for 1940 related to the last week in March. In 1045, 1940, and 1935, only fersons working the equivalent of two or more dars during the specified week were to he included. In 194., and 1940, only workers 14 years old and ower were to be included. In 1935, as in 1954 and 1050, there was no suerification regarding the age of the farm workers. No instructions were issued to include farm chores as film work in $1: 40$ and 1935 Censuses.

In censuses prior to 1954, farm-labor data were not always satisfactorily reported when the specilied week for reporting the number of persoms emplosed did not immediately precede the week during which the actual enumeration was made. When the week, for which a report for the number of persons employed was required, was several weeks before the week of enmmeration, the farm operator or the enumerator often reported the lighest numher of persons employed during the sear. When it was obvious that the data were not correctly rejorted, adjustments were made to make the data reflect more nearly the situation during the specified week. Beeause of demand for the data, the information on number of persons working on farms, for the 1954 Census, relates to a specified week. In some cases, this specified week was
several weeks before the week of actual enumeration. However, few adjustments, were made in the data for 1074 even though there were indications that there was incorrect reporting or that the report may have referred to a week other than the week siecified.

Regular and seasonal workers.-Hired persons working on the farm during the speritied week were classed as "regular" workers if the feriod of actual or expected employment was 150 days or more during the year, and as "seasonal" workers if the preriod of actual or expected employment was less than 150 days. If the period of expected employment was not reported, the pleriod of emplorment was estimated for the individual farm after taking into account such items as the hasis of payment, wage rate, expenditures for labor in 1954, and the type and other characterlstics of the farm.
Hired workers by basis of payment.-Hired persons were also (lassified according to the hasis of payment. The questionnaire called for the numbers of hired workers paid on a monthly basis, on a weekls hasis, on a daily basis, on an hourly hasis, and on a piecework basis. If the basis of payment was not reported for any of the hired werkers, the missing information was supplied.
Wage rate and hours worked.-The rate of pay (except for workers on a piecework basis) and the hours that workers were expected to work to earn this pay (except for workers on hourly hasis or on piecework basis) were asked for each class of worker. For 1954 , the data include estimates of hours worked and wage rates for questionnaires incomplete for either of these items. Estimates were based upon relationships existing on nearby farms of similar size and type. Data for 1950 for hours worked and wage rates were restricted to farms reporting both wage rates and hours worked.
Fertilizer and lime.-The 1954 questionnaires contain inquiries on the tonnage and cost of fertilizer and liming materlal and the acreage on which they were used during the calendar year 1954. Fertilizer and lime used on the phace were to be included regardless of whether the landowner, tenant, or both paid for them. Fertilizer was to include only commercial fertilizer or fertilizing material. No specific mention was made of basic slag. It was thought that this byproduct of steel production would be considered as a fertilizing material. Barnyard manure, straw, refuse materials, and soil conditioners were to be excluded. Lime or liming material was to include ground limestone, hydrated and burnt lime, marl, apster shells, etc. No mention was made of g.psum but this product was excluded in the processing when the entries for surth were defected. Lime used for sprays or sanitation purposes was to be omitted.

Acres on which purclased materials were used were to be reported for both lime and fertilizer. In ase fertilizer was applied to the same crop more than onde in 1954, instructions were to report acres of land only once but to report the total tonnage used. The acres fertilized and tons applied were obtained separately for selected crops. The selected cous varied by regions. This arrangement made it possible to obtain data for crops nost commonly fertilized in the region.

For some counties, the tomage of lime shown in the table may be less than the tonnage reported for the Agricultural Conservation Program. In some cases, the difference may arise because of sampling error and in other cases, it may be the result of underreporting by farm operators. Many of the differences disappear when the data are presented for larger areas.

In the Sonth, some landlords, who conducted some farming nerations themselves, reported for their operations fertilizer and lime paid for wholly or in part ly them for use on their tenantoperated land. The tenants may also have reported the fertilizer and lime. During the eliting procedure such reports, when detected, were adjusted to prevent duplication in the reports for fertilizer and lime by landords and their tenants.

Specified farm expenditures,-The 10.4 Census oltained data for solected farm expense items in addition to those for fertilizer and lime. The expenditures were to include the total specified expenditures for the thace whether made by landord, tenant, or both.

Expenditures for machine hire were to include any labor included in the cost of such machine hire. Machine hire refers to custom machine work such as tractor hire, threshing, combining, silo filling, baling, giming, plowing, and spraying. If part of the farm products was given as pay for machine hire, the value of the products traded for this service was to be included in the amount of expenditures reported. The cost of trucking, freight, and express was not to be included.

Expenditures for hired labor were to include only cash payments. Expenditures for honsework, custom work, and contract construction work were not to be included.

Expenditures for feed were to include the expenditures for pasture, salt, condiments, concentrates, and mineral supplements, as well as those for grain, hay, and mill feeds. Expenditures for grinding and mixing feeds were also to be included. Payments made by a tenant to his landlord for feed grown on the land rented by the tenant were not to be included.

Expenditures for gasoline and other petroleum fuel and oil were to include only those nsed for the farm business. Petrolemm prodncts used for the farmer's antomobile for pleasure or used exclusively in the farm home for heating, cooking, and lighting were not to be included.

Farm-mortgage debt.-Data on farm-mortgage debt will be contained in a special report (Part 5 of Volume 1lI) to be issued in 1956. This report will contain data only for states and larger geographic areas.

## Crops

Crops harvested.-The agriculture questionnaire was organized to make prossible the listing of acreage and quantity harrested for each crop. To facilitate the enumerator's work, specific crop questions were varied according to areas (usually each area comprised a State or a group of States). Regionalizing questionmaires made it possible to devote special attention to the more important crops for a given area and also to use the unit of measure that was in most common use in the area.

In most instances, the harrested acreage that was reported for individual crops represents the area harvested for the 19.4 crop year. An exception was made for land in fruit orchards, vineyards, and planted nut trees; in this case the acreage represents that in both bearing and nonhearing trees and vines as of the date of enumeration (usually October or November 19:5). The acreage harvested for various crons is often less than the acreage planted.

With three exceptions, citrus fruits, olives, and avocados, figures for quantity harvested represent the amount actually harvested during the 1954 crop year. Citrus frnit production was to be reported for the 1953-1954 marketing season (from the bloom of 1953). Olive and avocado production for Califormia related to the quantity harvested from the 19.3 bloom (an instruction to enumerators referred to the marketing season which began October 1, 1953). In Florida, the avocado production period, according to the Enumerator's Instruction Book, was to include the quantity harvested from the 19.3 bloom (the harvesting season extending from July 1,1953 , to Junc 30,1954 ).

The unit of measure used for reporting the quantity harvested for some crops has varied, not only from State to State, but from census to census, to permit reporting in units of measure currently in use. In the State and county tables, figures on quantity harvested for each crop are shown in the unit of measure appearing on the 1954 Agriculture Questionnaire. When required, data for earlier years were converted into units of measure differing from those which were used in the published reports for those years.

Corn.-The liquiries regarding corn acreage and quantity harvested were not the same in all States. In areas where farmers frequently use units of measure such as baskets, barrels, etc., the questionnaire permitted the reporting of quantits harvested in bushels or in an alternative unit of measure. When alternative
units of measure other than bushels (shelled basis) were reported on the questionmare, the quantity was converted into busluels prior to tabulation. As in former censuses, farmers in certain areas had a tendency to report the quantity of corm harvested in terms of baskets of ear corn, barrels, or some unit other than bushels of corn on a shelled basis. Such reports, when detected, were corrected to represent the equivalent bushels of 70 pounds of ear corn or 56 pounds of shelled corn.

Annual legumes.-Acres and quantity harvested for the most important uses of soybeans, cowpeas, and peanuts, as well as the total acreage grown for all purposes, were obtained for areas where these crops are grown extensively. The total acreage grown for all purposes includes some acreage not harvested as the acreage plowed under for green manure was included. In certain States, separate figures were obtained for the acres grown alone and the acres grown with other crops. For the 19.4 Census, enumeritors were instructed to report acres and value of sales for cowpeas harvested for green peas with vegetables harvested for sale. For 1949, the total acreage of regetables harvested for sale, shown in state and county tables, includes the atores of cowpeas harvested for green leas for the following states: Alabama, Florida, Georgia, Louisiana, Mississippi, North Caroliua, South Carolina, and Texas. However, for 1949 the number of farms reporting and the value of vegetables harvested for sale do not include farms reporting or the value of cowpeas harrested for green peas.

Hay crops.-The tables contain data regarding the total acres of land from which hay was cut. Sorghum, soybean, cowpea, and peanut hays were exeluded from this total as separate questions were provided in those States where these crops are imporiant. The figures for fotal land from which hay was cut for 1954 were obtained by adding the acres of the various hay crops, including grass silate, for each county. The comparable figures for the 1950 Census were obtained by an inguirs of the farm olerator. Alfalfa hay includes any production which was dehydrated. The tonnage of alfalfa hay for dehydration (as well as that for other hass bot not for grass silage) is given on a dry-weight basis.

Enumerators and farmers were instructed to report the total quantity of hay harvested from all cuttings, but to report only once the acres of land from which more than one cutting was made. For 1954 , alfalfa hay included alfalfa and alfalfa mixtures. Likewise, clover and timothy hay included clover and timothy and mixtures of clover and grasses. For 19m0, the agriculture questiomuaire contalned instructions to report mixed has under the kind of hay that made un the largest part of the mixture. The differences in the instructions for reporting mixed hays affect the comparability of the data for the 1954 and prior censuses. The kinds of hay to be reported under "Other hay" Faried from State to state, and can be determined fur a specific State by referring to the cons of the questionnaire in the Appendix.

Clover seed, alfalfa, grass and other field seed crops.-The 1954 questionnaire contained separate inquiries for a number of the field seed crops and provided a question on "other field seed crops" for the parpose of ohtaining information for all minor field seed crops harvested.

Irish potatoes and sweetpotatoes.-The $\mathbf{1 9 5 4} \mathbf{C}$ Census inquiry for both Irish and sweet potatoes called for acres harvested and the quantity harvested. If less than 20 bushels (or 10 bags in specified States) of 1 rish potatoes or if less than 20 bushels of sweetpotatoes were harrested, the enumerator was instructed to report the quantity harvested, but not the area harvested. This method of reporting was used in order to facilitate the enumeration of potatoes grown on small plots for home use. The procedure and inquiries for both Irish potatoes and sweetpotatoes were essentially the same for 1950. Data for censuses prlor to 1950 are not entlrels comparable with those for 1950 and 1954. Earlier censuses did not eliminate the acres of the small plot-home-use production of Irish potatoes and sweetpotatoes. There-
fore, especially in counties or states where the production of putatoes is largely for home nse, the data on acres for 1954 and 19.5 are not fully comparable with those for earlier censuses.

Berries and other small fruits.-The questionnaire called for arreage and quantity harvested in $19: 4$ for sale. Nonbearing areas and areas from which herries or fruits were not harvested for sale were not to be reported. Separate inquiries were carried on the questionnaire for such berries as strawberries, blackberries, and rasplocries (tame) in States where production of these crops was important commercially.

Tree fruits, nuts, and grapes.-For 1954, the number of trees or rines and the quantity harvested were not enumerated if there Was a totad of less than 20 fruit or nont trees and grapevines on the farm. For censuses prior to 1954, enumerators were instructed to report the number of fruit or nut trees and grapevines and the quantity harvested, regardless of how many trees or grapevines were on the farm. Because of this change in instructions, the data for 1954 are not fully comparable with those for prior censuses. In commer"ial fruit-producing counties, the change in instructions may have affected considerably the number of farms refortinir, but had little effect on the nomber of trees or the quantity harvested. On the other hand, in connties where most of the fruit and nut trees and grapevines are in smalt piantings, largely for producing fruit or nuts for consumption on the farm, the change in instructions may have resulted in a reduction not only in the mumber of farms reporting, but also in the nmmer of fruit and nut trees and grajevines, as well as in the quantity harvested.

For 1954, the acreage in fruit orchards, sroves, wineyards, and Manted nut trees was not enmmerated if there were less than 20 fruit or out trees and grapevines on the farm. For the 1050 Census, enumerators were instructed not to report the area in fiuit orchards, groves, vineyards. and planted nut trees if the area was less than one-half acre. For censuses mrior to 19.0. enumerators wore instructed to report the area in all orchards, vinefards, and planted mut trees regardless of size of the area. Ilnwever, frequently enumerators did not report the area for small fruit plantings and home orchards. In areas where small fruit and nut blantings or home orehards comprise a considerable bart of the total fruit and nut acreage, considerable change mar lee indicated from census to census in the acreage of land in fruit trees, planted mut trees, and grapevines becanse of differences in enumeration proerlures or in the enumerators application of the instructions.

In the regional questionnaire for Arizona and California, the arreage in each individual fruit and nut crop was secured.

The acreage in fruit and planted nut trees and grapevines does not usually include the acreage of witd pecans that were not planted. For Maine, the acreage in cropland harvested includes the acreage from which wid hueberries were harvested.

The unit of measure used for the quantity of fruits, grapes, and nuts harvested varied from State to State. Tahles in this report show the quantity harvested in the unit of measure appearing on the 19\%-4 Agriculture Questionnaire.

Nursery and greenhouse products.-The agriculture questionmaire inchuded three inguiries relating to horticultural-specialty crops. One called for acres and value of sales in 1034 of nursery products (trees, shrubs, vines, ornamentals, etc.). Another asked for the area grown under glass; area grown in the open; and value of sales of cut flowers, potted plants, florist greens, and bedding plants. The third ralled for area grown under glass or in house ; area grown in the open; and vatue of sales of vegetables grown under glass, flower seeds, vegetable seeds, vegetable plants, halbs, and mushromms. The inumiries in $105+$ were essentially the same as those used in the 1060 Census.

Value of crops harvested and value of crops sold.-The total ralue of crops harvested represents the value of all crops harvested during the crop rear 1954 . It includes the value of the part of the crop consumed on the farm and the value of the part of the
crop used for seed on the farm, as well as the value of the part of the crop that was sold.

Farmers were not asked to report the value of crops harvested. The values were calculated in the central office by multiplying the quantity harvested for each crop by the average price at which the crop was sold In the State. These State average prices were obtained cooperatively by the Agrlcultural Marketing Service, United States Department of Agriculture, and the Bureau of the Census. The mices are based on reports provided by a sample of farmers and dealers. However, average prices were not calculated for regetables harvested for sale, nursery and greenlıouse products, and forest products. In the absence of the value of quantities harvested for these products, the value of sales which was obtained in the enumeration was used in calculating the total value of crops harvested.

State Table 16 gives data for the value of that part of each crop sold. The questionnaire did not call for reports of sales (quantity sold or the value of sales) for all crops. Estimates of the quantities sold were made in the central office for those crops for which the quantity sold was not emmerated. (For the procedure used in estimating the quantity of each crop sold, see Value of farm products sold, page XXlli.) For each crop, the quantity sold was multiplied by the average State price in order to ontain the value of the quantits sold. Enumerators and farmers were instructed to report the landlord's share as sold unless it was used for feed or seed on the mace where it was produced.

In 10no, the value of crops sold was ohtained by inquirs of carh farm operator during the enumeration.

Forest products.-The forest products data obtained by the Census relate only to those prodncts cut on farms. Commercial logging, timber operations, and forest products cut on places not counted as farms are excluded. Therefore, the data published do not show the lotal forestry ontput and income for a county or State.

The questions lncluded in the 1954 questlonnaire were essentially the same as those for 1950. However, a change was made in the enumeration of the sales of standing timber. In 1950, a special question asked for "sales from standing timber," while in 10.4, instructions were to rejort any standing timber cut as sawlogs and veneer logs.

## Irrigation

Irrigated land was defined as land to which water was applied by artificial means for agricultural purposes. Water applied by subirrigation was included as well as that applied to the surface. Irrigated land included land irrigated by a sprinkler system. Land flooled during high-water periods was to be considered as irrigated land only if water was turposely applied for agricultural purposes by means of dams, canals, or other works. Regulation of the "water tahle" by drainage works was not to be included as irrigation.

There were two gronps of irrigation inquiries used for the 1954 Census. One group was used in the 17 Western states (Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah. Washington, and Wyoming) and in Arkansas, Florida, and Louisiana. The other group was used in the remaining 28 States. In the 17 Western States and Arkansas, Florida, and Lonisiana, the agriculture questionnaire contained severat inquiries regarding irrigation. These inguirles related to the area of irrigated land from which crops were harvested and the names of the crops for which the entire acreage harvested was irrigated in 1954. In all of these States except Arkansas and Iouisiana, the area of irrigated pasture was also obtained. In the remaining States, the agriculture questionnaire called for only the total acres irrigated in 1954 . This acrage may have been used for harvested crops, soll-improvement crops, or for pasture.

The inquiries relating to irrigation for the 1954 Census were essentially the same as those for the 1950 Census. However, in

1950 , irrigated land from which no crop was harvested was included as irrigated land, while such acreage was not obtained in 1954.

Considerable data are published regarding irrigation in the 17 Western States and Arakansas, Florida, and Louisiana. The following definitions apply to these States:

Irrigated farms.-These are farms reporting land irrigated. Data on land in irrigated farms and on land in irrigated farms according to use include the entire acreage of land in these farms, whether irrigated or not.
Land irrigated.-This relates only to that part of the land in irrigated farms to which water was applied. However, for Arkansas and Lonisiana the total for irrigated land does not include land used solely for pasture or grazing. For the 17 Western States and for Arkansas, Florida, amd Louisiana, this total does not include irrigated cropland that was not harvested and not pastured.

Irrigated land in farms according to use.-This classification provides data on the use of irrigated land in farms and includes that part of the cropland harvested that was Irrigated as well as that portion of the land pastured to which water was applied.

Farms with all harvested crops irrigated.-These are all "irrigated farms" on which all crops harvested were grown on irrigated land.

Irrigated crops harvested.-The data for irrigated crops harvested include (1) the acreage of crops harvested on irrigated farms on which all harvested crons were irrigated and (2) the acreage of those crops which were wholly irrigated on farms where a part of, or all of, other harvested crops were not irrigated. Thus, the reported acreage in irrigated crops may not include the total acreage of each harvested crop grown on irrigated land, but the exclusions are minor. However, in the case of vegetables harvested for sale and orchard fruits and nuts, the data for farms reporting number of trees, value of sales, etc., relate only to those crops harvested on farms on which all crops were irrigated.

## Land-Use and Conservation Practices

Land in cover crops turned under for green manure.-The data for this item represent land on which a cover crop was turned under in 1954 and another crop was planted for harvest after 1954 . Such acreages were to be reported even though the succeeding crop may later have failed. This inquiry was not made in Arizona, California, Colorado, Jdabo, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming, and the western part of Texas.
Stripcropping.-The data for stripcropping relates to the area of row crops or close-seeded crops that were grown in strips across the path of prevailing winds to prevent or reduce the blowing of topsoil. This question was included only in Colorado, ldaho, Kansas, Montana, Nehraska, Nevada, New Mexico, North Dakota, Ohlahoma, Oregon, South Dakota, Utah, Washington, Wyoming, and the western part of Texas.

Cropland used for grain or row crops farmed on the contour.This is the area for all grain and row crops that were planted around the slope to maintain comparatively level rows instead of being planted in straight rows running up and down the slone.

## Livestock and Poultry

The 1954 questionnaire called for an inventory of or for some phase of production for all the inportant kinds of farm animals and poultry. Respondents were asked for the numbers on hand on the day of enumeration. Livestock were to be enumerated on the place on which they were located, regardless of ownership. Livestock grazing in national forests, grazing districts, or on open range at the time of enumeration were to he reported for the farm or ranch to which they belonged.
The time of the year at which livestock and poultry were enumerated influences greatly the resulting data. Therefore, the date of the enumeration needs to be considered when comparing

1954 tutals with those for corresponding items for the 1900 or prior censuses. The 1950 data represented a spring inventory (April 1, 1950), while the current census provided a fall inventory. The 1904 enumeration came at a time of large scate movement of thocks and herds from one range to another, from ranch to feeder, and from farm or ranch to market.
The censuses of agriculture beginning with 1920 and continning through 1950 were taken as of either April 1 or Januars 1. The censuses taken in the years ending in " 0 " were taken as of April 1 , while the censuses taken in the years ending in " 5 " were taken as of January 1. An enumeration made in April results in a count that differs considerably from a count made in January. In nost areas a large number of animals are born between January and April. On the other hand, a considerable number of older animals are sold or die during the 3 -month period, January to April. In the range states, sheep ind cattle are moved, with the change in season and grazing condition, from one locality, or country, to another. This movement may affect the comparability of data for counties and, in some cases, for States. The comparability of the data for the number of livestock and poultry has also been affected by changes in age groups and questionnaire inquiries from census to census. State Table 12 presents a description of the various age and sex groups of lisestock and poultry for each census from 1920 to 19.4.
Milk cows; cows milked; milk sold.-Data on number of cows milked and milk production relate to the day preceding the enumeration.

Questionnaires in 25 States, chiefly western and midwestern, provided three alternative units of measure for enumerators and respondents to report whole milk sales: (1) Pounds of milk, (2) pounds of butterfat, and (3) gallons of milk. In the other States, sales of whole milk on the basis of butterfat content were considered relatively unimportant and, therefore, the unit of measure (pounds of butterfat) was omitted from the questionnaire. However, for publication by States, the reports for whole milk sold were converted into a unit of measure common to the particular State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of whole milk, as shown by data furnished by the Agricultural Marketing Service of the United States Department of Agriculture.
The tables for economic areas contain figures on total milk sold. These figures represent the total equivalent of milk and pounds of butterfat in cream sold in terms of whole milk.

Total sales of all dairy products for 1954 are not entirely comparable with those for 1949. The value of sales for whole milk and cream was included in both the 1954 and 1945 Censuses. In 1950, the value of the sales of butter, buttermilk, and cheese was obtained; the value of these products was not included in 1954.

Sows and gilts farrowing.-The 1954 questionnaire asked for spring litters by an inquiry on the number of sows and gitts farrowing between December 1, 1953, and June 1, 1954, and for fall litters by an inquiry on the number of sows and gilts farrowing since June 1, but before December 1, 1954. The inquiry relating to sows farrowing or expected to farrow during the fall was incIuded in the census for the first time in 1954. The 19:5 data for spring farrowings (sows and gilts farrowing between December 1, 1953, and June 1, 1954) are comparable with those for 1950. Since no data were obtained in 1950 for fall farrowing, only the 1954 data for farrowing after June 1 are given. For a number of counties, the ratio of sows farrowing to the number of hogs and pigs on hand, plas those sold, may be low becanse hogs or pigs were shipped into the countr for feeding. Adjustments in the number of sows farrowing were made both for suring and fall litters when there was substantial evidence that the number of sows farrowing was not reported. The adjustments were made largely in counties outside the major hog-producing areas.

Sheep and lambs and wool.-Questionnaires for all States, except Florida, Georgia, and South Carolina, contained inquiries
regarding sheep and lambs. In Florida, Georgia, and South Carollna, the enumerator was lnstructed to report the number of sheep and lambs In the remarks section. However, no data on the number of sheep and lambs or on wool production were compiled for these 3 States for 1954.

Goats and mohair.-In Louisiana, New Mexlco, Oklahoma, Orecon, Texas, Washington, and selected counties in Missouri, special questions were provided for reporting goats and mohalr. These questions called for the number of all goats, Angora goats, and other goats, separately, and for the number of goats clipped and pounds of mohalr cilpied in 1954.

Bees and honey.-Provision wats not made for reporting beea or honey for the 1954 Census.
Value cf livestock on farms.-The values for 1954 shown in State Table 13 were secured by multiplying the number of each class of livestock or foultry on hand by the State average price. These prices were obtained moperatively by the Agricultural Marketing Service, United States Department of Agriculture, and the Bureau of the Census.

Livestock products.-The inquiries regardlng ilveatock production and sales relate to the calendar year 1954, and those for sales of livestock products relate to the products produced in 1954.

Sales of live animals. - The 1054 questionnaire called for the number and ralue of sales of animats sold alive from the place during 1954. The questions used were similar to those used in the 1950 Census. The difference in the time of enumeration for the two censuses may have affected the comparability of the data. Slnce the 1954 Census was a fall enumeration, an additional problem was involved $\ln$ getting lnformation on anlmais sold allve. It kas necessary not only to ask the respondent for sales he had made durlng 1954 prior to the date of the enumeration, but also for an estimate of sales be would make during the remainder of 1954. Some respondents may not have rejorted sales to be made after the enumeration but before December 31, 1954. No data are arailabie to lndicate the extent of under-reporting of sales of livestock and poultry.

Poultry and poultry products.-For the 1954 Census, chicken sales were subdivided lnto sales of (1) broilers and (2) other chickens. This is the first census in which broflers were enumerated separateiy. The enumeration of broilers presented problems becanse of the varled contractual arrangements under which broilers are produced. The agriculture questionnaire contained the following instruction: "Report all broilers sold from this place lncluding those ralsed for others under contract." In a number of cases, young chickens were reported as broilers sold. Entries of less than 1,000 chickens or broilers sold, for individual furms, were tabulated as other chickens sold.

## SAmpling

Sampling was used for the 1954 Census of Agriculture in two ways. Flrst, information on fertilizer and lime, farm expenditures, farm labor, off-farm work, facillties and equipment on the place, farm vaiue, and mortgage debt, was enumerated for only a sample of farms. (The lnformation in Sections VIlI through XIll of the questionnalre was obtained only for the farnis in the sample. See Appendix for copy of the questionnalre.) Second, some tabulations were prepared on the basis of a sample of farms. As a resuit, a greater rolume of data could be publlshed than if the reports for all farms had been used for every tabulation. Most of the data shown in this report by State economic areas are estlnates prepared on the basls of the tabulation of data for the sample of farms. These tabulations are for the same sampie of farms for which data were coliected on a sample basls during the enumeration.
Description of the sample for the 1954 Census.-The sample used for the 1954 Census of Agrlculture consisted of spectfed farms (gee page XIl for a description of specifled farms) and one-fifth
of the remaining farms. Thus, the sample included slightly more than 20 percent of all farms.

The actual selection of farms in the sample was made by census enumerators as part of the entumeration procedure. The enumerator listed the head of each household on a single line of the Enumerator's Record Book, and determined whether an agriculture questionnare was to be obtained. If he was required to fill a questionnaire, he entered the "number of acres in this place" in accordance with question 11 of the agriculture questlonnaire. On the basis of the number of acres in this place, the enumerator recorded a check mark in one of fire squares that provided for the recording of each farm in one of five size-offarm groups. Ali the squgres for farms with 1,000 or more acres were lightly shaded and a random fifth of the squares for each of the other four size groups was also lightly shaded. (See Appendix for an example of a page of the Enumerator's Record Book.) If the respondent was listed on a line for which the shaded square corresponded to the size of his farm, his farm was included in the sample. The agricniture questionnaire contained one or more inquiries at the beginning of Section VIIIthe first section containing inquiries to be asked for only a sample of farms (See copy of questionnalre in Appendix)-for the guidance of the enumerator as to whether the questionnaire was for a farm to be included in the sample and whether the farm quaiifled as a specified farm.

Adjustment of the sample. - An adjustment in the 20 percent part of the sample was made by a process essentially equivalent to stratifying the farms in the sample by size, for the purpose of (I) improving the relfability of the estimates from the sample on an economic area level, and (2) for the purpose of reducling the effects of possinie biases introduced because some census enumerators did not follow perfectly the method devlsed for selectlng the farms in the sample. In order to adjust the sample for each State economic area, counts were obtained of all farms and of sample farms for each of ten size-of-farm groups based on "acres in this place." The ten size-of-farm groups were as follows: ['nder 10 acres, 10-29 acres, $30-49$ acres, $50-69$ acres, 60-99 acres, 100-139 asres, 140-179 acres, 180-259 acres, 260-499 acres, and $500-999$ acres. In determining the extent of the adjustment, the difference between the numher of farms in the sample and the total number of farms divided by fire was obtained for each size group. The actual adjustment for the slze group was made bs either elfminating or duplicating, on a random basis, farms in those counties of the State economic area where the greatest ofer or under-representation existed.

Method of estimation.-l)ata which are based on the sample of farms were expanded to represent figures for all farms. The expanded figure for an item was obtained by multiplying by five the tahulated botai for that item for the farms in the 20 percent part of the sample and adding the total for the specified farms.

Reliability of estlmates based on the sample.-The estimates based on the tabulation of data for a sampie of farms are suhject to sampling errors. When data based on a sample of farms are shown in the same table with data for all farms, the data based on a sample are shown in italics. In case all the data in a table are estimates based on a sample, a headnote for the table indicates that the data are estimates hased on a sample of farms. Approximate measures of the sampling reliability of estimates are given in State Tabies 18 and 19 for farms reporting and for item totals. These measures indicate the general level of sampling reiability of the estimates, but do not include adequate allowances for sources of error other than sampling variation as, for example, errors in originai data furnished by farmers. Sources of error other than samping may be relativeiy more important than sampling variation, especially for totals for a State.

In generai, the neasures of sampiling reliability presented are conservative in that they tend to overestimate the variations $\ln$ sample estimates, because (1) the predicted timits of error do net always take fuliy into consideration that compiete data were
tahuated for all specified farms and (2) the maximum figures intended to serve for all economic areas were used. Consequentls, there is a tendenes to overestimate the variations in the sample. especially for groups with large numbers of farms or for groups for which the totals for specified farms represent a high percentage of the item totals.

Data in State Tables 18 and 1!) are given to assist in determining the gencral level of sampling reliability of estimated totals. In State Table 19 a list of the items is given and the level of sampling rehabitity as shown in state Table 18 is indicated. By referring to State Table 18 in the column for the level of sampling reliability designated in State Tahle 19 , the sampling error according to the number of farms reporting may be obtained. For farms reporting, the indicated level of sampling is level 1. State Table 18 shows percentage limits sum that the chanees are about 68 in 100 that the difference between the estimates based on the sample and the figure that would have been oltained from a tabulation for all farms would be approximately within the limit speeified. Howerer, the dances are 99 in 100 that the difference would be less than two and one-half times the percentage given in the table.

The data in State Table 18 indicate that when the number of farms reporting specified items is small, the item totals are subjeet to relatively large sambling errors. Nevertheless, the considerable detail for every elassification for each item is presented to insure maximum mefulness for apmraising estimates for any eombination of items that may be desired.

Percentage figures and averages derived from the tables will generally have greater reliability than the estimated totals; also, significant patterns of relationships may smmetimes be observed eren though the individual data are subject to relatively large sampling errors.

The data representing estimates based on a sample for the 1900 Census were obtained in essentially the same way as in Jot and the same State Tables 18 and 19 may he used to estimate the sampling errors for the 1950 data.

Differences in data presented by counties and by State economic areas.-In many cases, data presented by state ecounmic areas were estimatel on the hasis of tabulations for a sample of farms, while most of the data presented by countios were obtained by the tabulation of data for all farms in the comuty. However, data for the number of farms classified by type of farm and economic class of farm, and for the use of fertilizer and lime, farm expenditures, farm labor, farm facilities, farm equipment, and value of land and buildings were estimated for each county on the basis of the tabulation of data for a sample of farms in each countr. The same sample of farms was also used for the tabulation of data for these items for State economic areas and for the State. In some cases, the totals presented for these items for state economic areas or for the state will differ slightls, but not significantly, from the totals obtained by adding figures for counties in the State eronomic area or the State. As a matter of economy, small adjustments were not made in tbe tabulations when the difference was not large enough to affect the usefulness or reliability of the data.

## Classification of Farms

The chassifications of farms by color and tenure of operator, economic class of farm, and type of farm were made on the basis of risual inspection of each questionnaire during the office proeessing.

The classification for color and tenure of operator was made for all farms, while the classifications by ecomomic class and by type of farm were made for only a sample of farms. The classitication of farms by size was made for all farms by means of electric tabulating equipment.

Farms by size.-Farms were classified by size according to the total land area of each farm. The same classifieation was used for all States.

In analyzing size-of-farm statistics, eousideration should be given to the definition of a farm for census purposes. Census farms are essentially operating units, not ownership traets. If a landord has croppers or other tenants, the land assigned each eropper or tenant is a selarate farm even though the landlord may operate the entire holding essentially as one farm in respect to supervision, equipment, rotation practices, purehase of supplies, or sale of products.

In some parts of the South a special questionnaire, the Land-lord-Tenant Questionnaire, was used to obtain statisties for such multiple units. The statistles for multiple unlts will be published in Volume III, Part 1.

Farms by tenure of operator.-Farm operators are elassified aecording to the tenure under whifl they hold their land on the basis of the replips to the inguiries on total land owned, total land rented from others, total land managed for others, and land rented to whers. The basis of chassification hy temure is, in general, the same for the 1904 as for the 1900 Census. In 1900. for an operator who owned land and rented land from others, there was no way to determine whether land rented to others represented land owned by the operator or land rented by the operator from others; therefore, such an opterator was classified as a part owner. In 1945, and eartier, full owners, part owners, and tenants were classified on the basis of the land retained. Under this earlier classification a part owner who sublets to others ath the land he rents from others would have been dassified as a full owner; a part owner who rents to others all the land he owns would have been classified as a temant. In J9.4, the arreage of owned land that was rented to others was uhtained $\mathrm{f} \rightarrow \mathrm{m}$ the first time. Thus, it was fossible to chassify al firm operator who owned land and rented hand from others as a full owner, part owner, or tenant aceording to the ownership or rental of the land he retained.

Full owners own land lut do not retain any land rented from others.
Part owners own land and rent land from others.
Managers operate farms for others and are paid a wage or salary for their services. Persons acting merely as earetakers or hired as laborers are not elassified as managers. If a farm operator managed land for others and also operated land on his own account, the land operated on his own account was considered as one farm and the land managed for others as a second farm. If a farm operator managed land for two or more employers atl the land managed was considered one farm.
Tenants rent from others or work on shares for others all the land they operate. Tenants are further classitied on the basls of their rental arrangement as follows:

Cash tenants fay (ash as rent, such as $\$ 10$ an aere or $\$ 1,000$ for the use of the farm.

Share-cash tenants pay a part of the rent in eash and a part as a share of the crops or of the livestock or livestoek produets.

Share tenants pay a share of either the erops or livestock or livestock products, or a share of both.

Crop-share tenants pay only a share of the crops.
Croppers are crop-share tenants whose landtords furnish alt work power. The landlords either furnish all the work animats or furnish tractor power in lipu of work animals. Croppers usnally work under the chse sufprvision of the landowners, or their agents, or another farm operator, and the land assigned them is often merely a part of a larger enterprise operated as a single unit.
Livestock-share tenants jay a share of the livestock or livestoek products. They may or may not also pay a share of the erops.

Other tenants include those who pay a fixed quantity of any product ; those who inay taxes, keep up the land and bildings, or keep the landord in exchange for the use of the land ; those who have the use of the land rent free; and others who could not be included in one of the other specified subelasses.

Unspecified tenants iuchade those tenants for whom the rental arrangement was not reported.

For earlier censuses, the detinition for each subelass of tenant is essentially the same as for 195t. However, in 1945 the enumerator was asked to determine the subclass of temants, white in 1954, 1950, 1940, and earlier censuses the classifieation was made during the prosessing of the questionnaires on the basis of the answer to the inguiries on the questionnaires. The
procedure for 1945 may have affected the comparability of the data, particularly those for cash tenants and share-cash tenants.
Farms by color or race of operator.-Farm operators are classified by color as "white" and "nomwhite." Nonwhite includes Negroes, Indians, Chinese, Japanese, and all other nonwhite races.

Farms by economic class.- A classification of farms by economic chass was made for the purpose of segregating groups of farms that are somewhat alike in their characteristics and size of operation. This ctassification was made in order to present an accurate description of the farms in each class and in order to provide basic data for an analysis of the organization of agriculture. Only the farms in the sample were classified by economle class. The totals given in the tables represent estimates for aft farms based on tabulations of the data for the farms inctuded in the sample.

The classification of farms by economic class was made on the basis of three factors; namely, total vatue of all farm products sold, number of days the farm operator worked off the farm, and the relationship of the income received from nonfarm sources by the operator and members of his famity to the value of all farm products sold. Farms operated by institutions, experiment stations, grazing associations, and community projects were ctassified as abnormal, regardless of any of the three factors.

For the purpose of determining the code for economic class and type of farm, it was necessary to obtain the totat value of farm products sold as well as the value of some individual products sold.

The total value of farm products sold was obtained by adding the reported or estimated vatues for all products sold from the farm. The value of livestock, livestock products except wool and mohair, vegetables, nursery and greenhouse products, and forest products was obtained by the enumerator from the farm operator for each farm. The enumerator also obtained from the farm operator the quantity sold for corn, sorghums, small grains, hays, and small fruits. The vafue of sales for these crops was obtained by multiplying the quantity sold by State average prices.

The quantity sold was estimated for all other farm products. The entire fuantity produced for wool, mohair, cotton, tobacco, sugar beets for sugar, sugarcane for sugar, hroomcorn, hops, and mint for oil was estimated as sold. If the estimated value of the quantity sold for any other crop was $\$ 100$ or more, the entire quantity harvested was estimated as sold. To obtain the value of each product sold, the quantity sold was mutiplied by State average prices.

In making the classification of farus by economic class, farms were grouped into two major groups, namely, commerciat farms and other farms. In general, all farms with a value of sales of farm products amounting to $\$ 1,200$ or more were classified as commercial. Farms with a value of sales of $\$ 250$ to $\$ 1,199$ were classified as commercial only if the farm operator worked off the farm less than 100 days or if the income of the farm operator and members of his family received from nonfarm sources was less than the total value of all farm products sotd. The remaining farms with gross income of $\$ 250-\$ 1,199$ and farms with a value of sales of all farm products of less than $\$ 250$, as well as farms operated by institutions, experiment stations, grazing associations and community projects were classified as "other farms."

Commercial farms were divided into six groups on the basis of the tutal value of all farm products sold, as follows:
 or provided the income the farmoperator and members of 100 days, received from nonfarme the farm operator and members of his family products sold.

Other farms have been gronped into three classes as foltows:
Part-time farms.-Farms with a value of sales of farm products of $\$ 2.0$ to $\$ 1,199$ were chassitied as prart time if the farm operator reported (a) 100 or more days of work off the farm in 1954, or (b) the nonfarm income receired by him and members of his family was greater than the value of farm products sold.

Residential farms.-Residential farms include afl farms excent abnormat farms with a total vatue of sates of farm products of less than $\$ 250$. Some of these represent farms on which the operator worked off the farm more than 100 days in 1954. Some represent farms on which the income from nonfarm sources was greater than the value of sales of agricultural products. Others represent subsistence and marginal farms of various kinds. Some farms ire included here which, if the ctassification were based on farm production for more than 1 year, might have qualified as commercial farms.

Abnormal farms_-lusufar as it was possible to identify them, abnormal farms include pubtic and private institutionat farms, community entermises, experiment-station farms, grazing associations, etc.
Farms by type.-The classification of farms by type was made on the hasis of the relationship of the value of sales from a particular source or sources to the total value of all farm products sold from the farm. In some cases, the type of farm was determined on the basis of the sale of an individual farm product, such as cotton, or on the basis of clesely related products, such as dairy products. In other cases, the type was determined on the basis of sales of a broader groulp of products such as corn, sorghums, all small grains, field peas, field beans, cowpas, and suybeans. I'art-time, residential, and abnormal farms were not classified by type. In order to be classificd as a particular type, sales or anticipated sales of a product or a group of products had to represent 50 percent or more of the total value of products sold.

Only the farms in the sample were chassified by type. The data given in this report by type of farm relate only to commercial farms.

The lypes of farms for which data are shown, together with the product or group of products on which the chassification is based, are:

Type of farm | Product or group of products amounting |
| :---: |
| to 50 percent or more of the value of all |
| farm products sold |

Cotton_- Cotton.

| Type of farm | Product or group of products amounting to 50 percent or more of the value of all farm products sold-Continued |
| :---: | :---: |
| General..--------- | Firms were classified as general when |
|  | the value of products from one source |
|  | or group of sources did not represent |
|  | as much as 50 percent of the totat |
|  | value of all farm products sold. |
|  | Separate figures are given for three |
|  | kinds of general farms: |
|  | (a) Primarily cron. |
|  | (t) l'rimarity livestock. |
|  | (c) Crop and livestock. |
|  | Primarily crop farms are those for |
|  | which the sate of one of the following |
|  | crops or gromps of crops-vesetables, |
|  | fruits and nuts, cotton, cash grains, |
|  | or other field crops-did not amount |
|  | to $\overline{\mathrm{to}}$ percent or more of the value of |
|  | all farm products sold, but for which |
|  | the value of sales for all these groups |
|  | of crops represented 70 percent or |
|  | more of the ralne of all farm products |
|  | sold. |
|  | Primarily livestock farms are those |
|  | which could not qualify as dairy |
|  | farms, poultry farms, or livestork |
|  | farms other thin clairy and poultrs. |
|  | but on which the sale of livestock and |
|  | poultry and livestock and poultry |
|  | products amounted to 70 nercent or |
|  | more of the value of all farm products |
|  | sold. |
|  | General crop and livestock farms are |
|  | those which could not be classified as |
|  | either erop farms or livestock farmus, |
|  | but on which the sale of all erops |
|  | amounted to at least 80 percent but |
|  | less than 70 percent of the tolal value |
|  | of all farm proclucts sold. |
| Miscellaneous | This group of farms inclurles those that |
|  | had 50 percent or more of the total |
|  | value of problucts accounted for by |
|  | sale of horticultural products, or sale |
|  | of horses, or sale of forest products. |

The classification of famms by type of farm for the 1954 Census was made on essentially the same hasis as that for the $10 \pi 0$ Census. In 19:0, miscellaneous farms included those that had 50 percent or more of the total value of products accounted for by the sale of fur animals, or the sale of bees and honey, in addition to the items included in the 1954 classiffcation.

Value of farm products sold.-Data on the value of farm produets sold were obtained for 1954 by either of two methods. First, the values of livestock sold alive, poultry, poultry products, vegetables harvested for sale, nursery and greenhouse products, forest products, and all livestock products, except wool and mohair, were ohtained during the enmmeration by asking the farm operator the value of sales.

Second, the values of all other agricultural products sold were estimated for each county. During the enumeration, the quantiy sold was ohtained for each farm, for corn for grain, sorghums for grain or forage, small grains, hays, and for all small fruits and berries. For all other crops, the quantity sold was estimated for each county. For the purpose of computing value of farm problucts sold, it was assumed that the entire quantity harvested, or reported, was sold for the following crops:

Strawberries
Blackberries
Dewberries
Raspberries
Blueberries
Boysenberries
Loganberries
Youngberries
Cranberries
Currants
Gooseberries
Elderberries
Other berries
Apples
Teaches (except in selected States where the proportion of the erop culled was considerable)

Clingstone peaches (except in a few States where the proportion of the crop culled was considerable)
Pears
Cherries
I'lums and prunes
Plums (except in selected States where the proportion of the crop culled was considerable)
Prunes (except in selected States where the proprortion of the crop eulled was considerable)

## Apricots

Avocados (except in selected States where the proportion
of the (rop) cutled was consimerable
Figs
Mangoes
Nertarines
Olives
Grapes
Bananis
Dates
Guavas
Jabanese persimmons
Jujuhes
t'apayas
Pineapples
Fomerranates
Quinces
Sapordillas
Soursops
Sugar apples
Loquats
Other tree fruits
Tung muts
Walnuts (English or Persian)
Almonds
Fitherts and hazelmuls
Black walnuts
('hestnuts
Cocomuts
Other muts
Oranges
Tangerines, mandarins, sat-
sumas (except in selected
States where the proportion
The quantity sold was estimated for the folluwing crojs on the hasis of crop-disposition data published ly the Agricultural Marketing Service of the U.S. Department of Agriculture:

Alfalfa seed
Red clover seed
Lespedeza seed
Swretclover seed
Timothy seed
Alsike seed
Soybeans for heans

Cowpeas for dry peas
Peanuts for muts
Dry field beans
sugarcane and sorghum for sirup
Maple sugar
Maple sirup

In the case of Irish potatoes and sweetpotatoes, the quantity sold was estimated after making allowance for home use, on the hasis of data on the disposition of these crops as published by the Agricultural Marketing Service of the U. S. Department of Agriculture.

The quantity sold for the following miscellaneons crops was estimated on the basis of the reported quantity or value of sales for the 19int Census or on the hasis of the quantity sold as shown for the 1950 Census:

Soybeans for hay
Cowneas for hat
Peanuts for hay
Velvetheans
Angelica
Anise (except for oil)
Arnica
Artemisia
Basil
Belladonna
Bloodroot
Borage
Buhach
Burnet
Cascara bark
Carambola
Cassava
Castor beans
Chicory
Chufas
Coriander
Dikon
Dill for oit
Fennel seed
Fejou
Flax for fiber
Foxglove
Ginseng
Gobbe
Golden seal

Guar
Hemp for fiber
Hemp for seed
Iaboticaba
Kudzu crowns
Lemon halm
Litchi nuts
Mint for oil
Oiticica nut
Ramie for fiber
Rape seed
Roselle
Safflower
Sesame for oil
Sorrel
Sugar beet seed
Sunflower seed
Sweet corn for seed
Teosinte
Vetiver
Wormseed oil
Lentils
Other grains
Grass silage
Other clover seed
Hubam clover
Mammoth elover
I'ersian clover
Sour clover
Crotalaria seed
of the crop culled was considerable)
Temple oranges
Valencia oranges (except in selected States where the proportion of the (crop) culled was considerable)
Navel oranges (except in selected States where the proportion of the crop culled was considerable)
other oranges (except in selected States where the proportion of the (ro川) cnlled was considerable)
Grapefruit (except in selected States where the proportion of the crop culled was considerable)
Lemons
Limes
Tangeloes
Kumquats
Citrons
Limequats
Other eitrus fruits
Cotton
lopeorn
Sugar beets for sugar
Broomcorn
Sugarcane for sugar
Tobacco

Indigo, hairy seed
Meadow foxtail
Feseue grass
Rbodes grass
The estimated value of all crops sold, except vegetables harvested for sale, nursery and greenhouse products, and forest products, was obtained by multiplying the estimated quantity sold by the State average price. The State average prices were ohtained by the Agricultural marketing Service of the U. S. Department of Agriculture.

In the case of miscellaneous crops listed above, the average prices have been determined on the basis of reports of quant by sold and value of sales olitained in the 19nt Census of Agrienture.

For the 1950 Census, the value of all farm products sold was ohtained by inquiry of each farm operator during the enumeration. In that census, inquiries were made regarding the value of farm products sold for a maximum of 46 individual farm products or groups of farm products. In most cases, the fuantity sold for the individual farm product was obtained together with the value of sales. The total value of farm products sold for 19 ano includes the vatue of several farm products not included in the figures for 1!nt butter, cheese, skim milk, bees, honey, corn fodder, corn silage, and grain straw, and receipts from the rental of pasture.

Data for the sales of farm products represent total sales for the entire film, regardless of who shared in the receipts. The landlord's share of crops and llvestock sold and also the livestock
which the landlord took from the temant farm to his own place were considered as sales from the temant farm. sales of crops grown on a contract basis, of livestock fed on a contract basis, or of poultry raised under a contract with a feed dealer or others, were included as sales from the farm.

The data on sales cover one year's operation. The sales of crops represent the sales of crous before the enumeration as well as those yet to be sold at the time of the enumeration. Corn, (o)ton, and other commodities under loan were to be considered as sold at loan prices. Livestork sales are for the calendar year regardless of when the livestock were raised or produced. Most livestock products are sold at the time they are produced. It was assumed that all wool and mohair shorn or elipued in 1954 was sold.

The valne of farm products sold does not include government payments for soil conservation, lime and fertilizer furnished, and subsidy payments.

When obtaining the value of the farm products sold from farm operators, the emmerators were instructed to report the gross value withont making dednctions of any kind. These instructions, however, were not always followed. In the ease of milk, proultry, egrss, etre, deductions were often made by boyers of farm products for hauling, handling, marketing, ete, hefore making payments to farmers. In such cases, farm operators often considered the amount of the check received as the gross value of the farm products sold.

\title{
State Table 17.-FARMS REPORTING BY SPECIFIED ACRES, QUANTITY HARVESTED, AND QUANTITY SOLD FOR SPECIFIED \\ CROPS: CENSUS OF 1954-Continued
}
[Data are basad on reports for only a sample of farma. See text]

\section*{State Talle 18. -sAMPLING REIIABILITY OF ESTINATED ToTALS FOR COUNTY, ECONOMIC AREA, AND ST ITE BY NUMBER OF FARUIS REPORTIVC, BY LEVELS}

 follows:
2. When the number of farms or farms reporting is 75 percent of all farms, multiply the percent error by 0.50 .
3. When the number of farms or farms reporting is 95 percent of all farms, multiply the percent error by 0.20 .

State Table 19.-INDICATED LEVEL OF SAMPLING RELIABILITY OF ESTIMATED COUNTY, ECONOMIC AREA, and state totals For specified items

Note: Items whose level is indicated by an \(x\) may be approxinated by using the level given for the state.

State Table 19.-INDICATED LEVEL OF SAMPLING RELIABILITY OF ESTIMATED COUNTY, ECONOMIC AREA, AND STATE TOTALS FOR SPECIFIED ITEMS-Continued
 is required also to the county, economic area, or State table in order to obtain the number of farms reporting]

Note: Itema wbose level is indicated by an \(X\) may be approximated by using the level given for the State.
